LANGUAGES

Python

FastAPI, Django, Flask, async

JavaScript / TypeScript

Node.js, React, Express

PHP

WordPress, production web dev

C# / Java

CS degree, strong OOP foundations

SQL

PostgreSQL, MySQL, query design

FRONTEND

React, TypeScript

HTML5, CSS3, responsive design

Mobile-first, cross-browser

Component architecture

BACKEND AND APIS

REST API design and development

Authentication, rate limiting

Input validation, secure coding

Async processing, webhooks

Microservices concepts

DATABASES

PostgreSQL (primary)

MongoDB, MySQL

Pinecone (vector search)

Schema design, optimisation

AI AND ML

RAG pipeline design

Vector embeddings, semantic search

LLM API integration (Claude)

Microsoft Copilot, Claude Code

Agentic workflow design

DEVOPS AND CLOUD

Docker, Docker Compose

GitHub Actions, CI/CD

AWS, Azure, Render

Git, version control

Structured logging, monitoring

PRACTICES

TDD, clean code

PROFESSIONAL PROFILE

Full stack software engineer with a BSc in Computer Science and a strong record of building, deploying, and maintaining production-grade systems independently. Proficient across Python, Node.js, React, TypeScript, PostgreSQL, MongoDB, PHP, and Docker, with hands-on experience in AI integration, RAG pipeline design, REST API architecture, and cloud deployment. Currently completing a BSc Honours in Security and Network Engineering, bringing a security-first mindset to every layer of the stack.

I have been the sole engineer maintaining a live production website for a client since June 2025, which has taught me what it means to take full ownership — not just of the code, but of the outcome. I build things that work, and then I make sure they keep working. Actively uses AI tools including Claude Code, Microsoft Copilot, and Cursor as core parts of the development workflow, with a clear view of where AI accelerates work and where human engineering judgment is irreplaceable.

PROFESSIONAL EXPERIENCE

Full Stack Web Developer · **Sewandgrow** · June 2025 – Present · Remote

Sole engineer for a live production WordPress and PHP website supporting all daily business operations.

- Maintained 100% uptime across 6+ months as the sole technical point of contact, owning the full development lifecycle from specification through to deployment and ongoing maintenance.
- Built and shipped new features, theme customisations, plugin integrations, and performance improvements on a PHP and JavaScript stack independently.
- Optimised site speed, responsiveness, and SEO, implementing mobile-first improvements and cross-browser compatibility fixes.
- Managed plugin conflict resolution, WordPress core updates, and site backups safely in a live environment.
- Diagnosed and resolved production issues through systematic root cause analysis, documenting solutions and communicating findings clearly to the client.
- Applied secure coding practices throughout including input validation, authentication, and data protection best practices.
- Used AI-assisted development tools daily to accelerate delivery, debug complex issues, and improve code quality.

PROJECTS

CarlQ · Python · FastAPI · React · TypeScript · PostgreSQL · Pinecone · Docker · GitHub Actions · 2025

RAG-powered SA used car intelligence application. Live on Render.

- Designed and built a full production RAG application where users ask plain-English questions about SA used cars and receive grounded, sourced answers — covering pricing, reliability, and known faults.
- Engineered the complete data pipeline from scratch: ingestion, preprocessing, vector embedding, semantic indexing via Pinecone, retrieval logic, and Claude LLM response generation with anti-hallucination prompt engineering.
- Built a Python FastAPI backend with clean REST API architecture, authentication, rate limiting, input validation, injection protection, and structured logging throughout.
- React and TypeScript frontend with component-driven architecture, responsive design, and smooth multi-step user interface.
- Deployed via Docker and GitHub Actions CI/CD on Render with PostgreSQL as the primary relational data store. Full production monitoring and error handling in place.
- Used Claude Code and Cursor throughout development to accelerate implementation and maintain code quality at pace.

Fleet Maintenance System · Node.js · Express · React · MongoDB · Docker · Docker Compose · 2025

Full-stack SaaS fleet and maintenance management platform. Live deployment.

- Built an end-to-end fleet management SaaS platform from scratch — vehicle tracking, maintenance scheduling, job cards, and role-based access control for fleet managers and technicians.

Agile, Scrum, code reviews
SDLC, technical documentation
Security-first engineering
AI-assisted development

SOFT SKILLS

Independent ownership
Client communication
Remote async collaboration
Fast learner, growth mindset
Problem-first thinking
Calm under pressure

- Designed and implemented RESTful APIs with Node.js and Express, MongoDB schema design with aggregation pipelines, and full authentication with JWT.
- React frontend with reusable component library, responsive layouts, and real-time data updates across dashboard views.
- Containerised with Docker Compose for consistent, portable deployment. Managed the complete SDLC independently from architecture through to live production.

Forex Trading Dashboard · React · TypeScript · FastAPI · PostgreSQL · WebSockets · Docker · 2025

Real-time forex trading analytics and charting dashboard.

- Built a real-time forex data dashboard with live price feeds via WebSockets, technical indicator calculations, and interactive charting using React and TypeScript.
- FastAPI backend with PostgreSQL for historical data storage, rate-limited API endpoints, and efficient data transformation pipelines for chart rendering.
- Designed for low-latency data delivery with streaming architecture and optimised query performance across large historical datasets.

Finance Dashboard · React · Node.js · Express · PostgreSQL · Chart.js · 2025

Full-stack personal finance tracking and visualisation application.

- Built a full-stack finance tracking application with income and expense management, budget tracking, and data visualisation via Chart.js.
- Node.js and Express backend with PostgreSQL, clean REST API design, and structured data models for financial categories and transactions.
- Responsive React frontend with interactive charts, date-range filtering, and clean component architecture.

CV Automation Pipeline · Python · FastAPI · Claude API · Async Processing · 2025

AI-powered job application automation service.

- Built a Python FastAPI service that ingests job descriptions and generates fully tailored CVs via the Claude AI API — featuring async processing, structured result delivery, rate limiting, and production-grade error handling.
- Designed clean RESTful endpoints with input validation and modular service architecture, demonstrating agentic AI workflow design in a production environment.

URL Shortener · Python · FastAPI · PostgreSQL · 2025

Production URL shortening service with analytics.

- Built a RESTful URL shortening service with secure hashing, collision resolution, expiry logic, redirect handling, and click analytics stored in PostgreSQL.

Chat System · Node.js · PostgreSQL · WebSockets · 2025

Real-time chat application with persistent message history.

- Real-time chat server using Node.js and WebSockets with SQL-backed message persistence, user authentication, and room management.

EDUCATION

BSc Honours — Security and Network Engineering · Eduvos · 2025 – Present · In Progress

Covers cloud computing architecture, cybersecurity, network design, compliance-aware system design, and service-oriented systems. Builds a security-first engineering mindset directly applicable to backend, cloud, and AI system development.

Key modules: Cloud Security, Network Architecture, Cryptography, Compliance Frameworks, Distributed Systems Security.

BSc — Computer Science · Eduvos · 2021 – 2024 · Graduated

Strong foundation across the full breadth of computer science. Java and C# were primary languages. Graduated with solid grounding in both theory and applied software engineering.

Key modules: Data Structures and Algorithms, Software Engineering, Databases, Object-Oriented Programming (Java, C#), Web Technologies, Networks, Operating Systems, AI Fundamentals, Systems Programming.

CORE COMPETENCIES

Technical ownership: Full lifecycle from architecture through to production and ongoing maintenance

AI-native development: Claude Code, Cursor, Microsoft Copilot — active daily use with clear engineering judgment

RAG and agentic systems: Production experience designing ingestion, retrieval, and LLM integration pipelines

Security mindset: Secure coding, authentication, input validation, compliance-aware design (Honours focus)

Client communication: 12+ months as sole technical point of contact for a live production client

Remote collaboration: Fully remote since June 2025, experienced in async communication and independent delivery

Continuous learning: 7+ production projects shipped while completing a full Honours degree simultaneously
